Clonación Repositorio por SSH

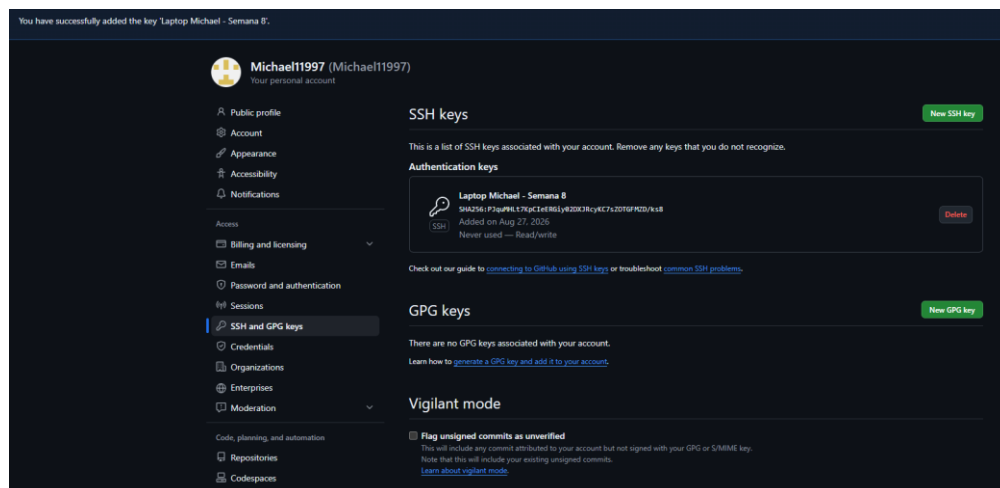

1. Obtención de la URL SSH

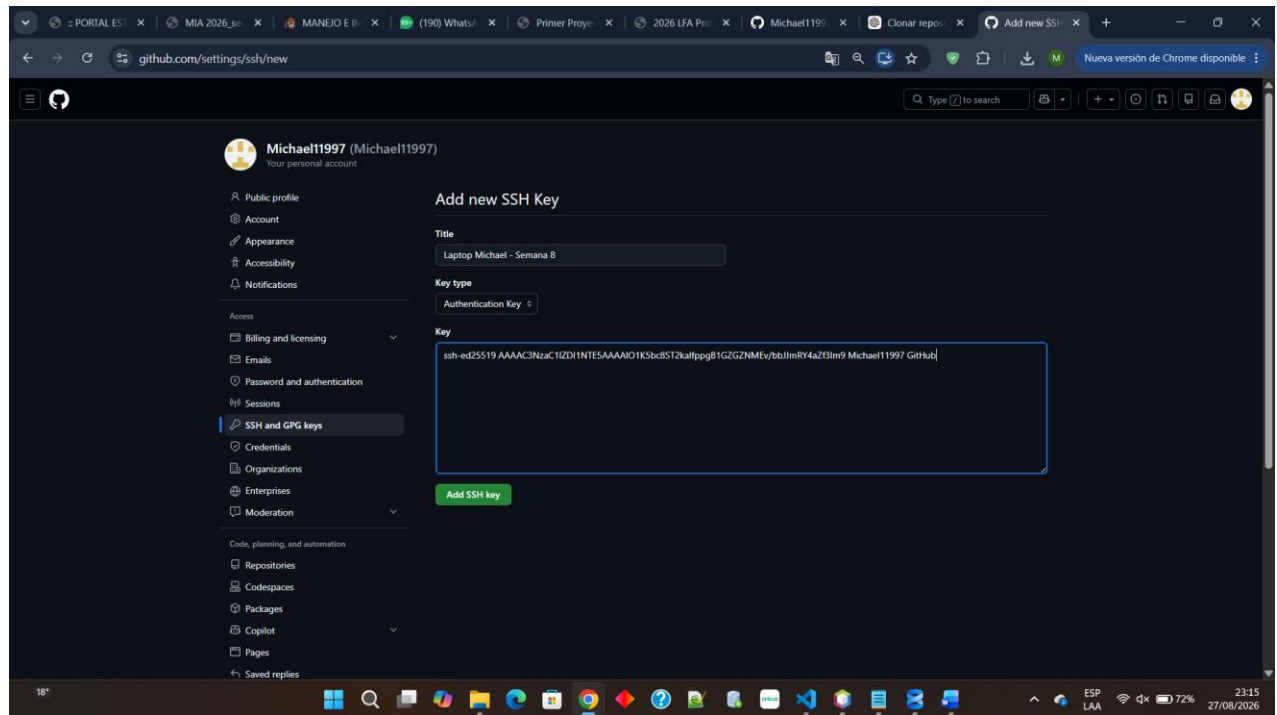

En el repositorio de GitHub se selecciono Code y luego la pestana SSH. La dirección obtenida utiliza el formato `git@github.com:usuario/repositorio.git`, que permite realizar operaciones Git mediante autenticación criptográfica.

2. Registro de la clave publica

Se genero una clave Ed25519. La clave publica se agregó a la cuenta de GitHub como clave de autenticación. La clave privada no se compartió ni se subió al repositorio.

3. Ejecucion de git clone y verificacion del fingerprint

Desde terminal se ejecuto el comando git clone con la URL SSH. En la primera conexion, GitHub mostro el fingerprint Ed25519 del servidor. Antes de aceptarlo se comprobo que coincidiera con el valor oficial:

SHA256:+DiY3wvvV6TuJJhbpZisF/zLDA0zPMSvHdkr4UvCOqU

4. Confirmacion del clonado exitoso

Despues de responder yes, SSH autentico la conexion utilizando la clave privada del equipo y la clave publica registrada en GitHub. La descarga finalizo con el 100 % de los objetos recibidos y las diferencias resueltas.

```

5. Autenticacion y verificacion final El comando `ssh -T git@github.com` confirmo que la cuenta Michael11997 se autentico correctamente. Luego, `git remote -v` mostro que las direcciones de fetch y push utilizan SSH. Finalmente, `git status` confirmo que la rama main se encontraba actualizada y sin cambios pendientes.
